There's only one thing wrong with the TS1000/ZX81.

Its keyboard.

Or rather its lack of one. Since it's flat your fingers don't feel as if there's any response to the pressure put on the keys.

In other words, you're not quite sure which keys you've pressed until the screen actually tells you.

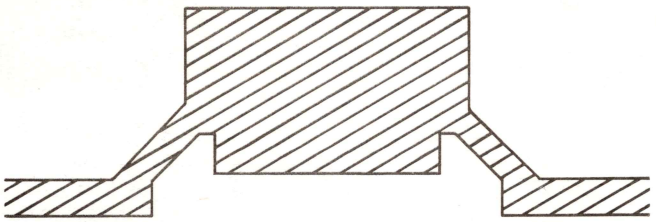
There are two ways of improving your TS1000/ZX81 keyboard.

One is to plug in a separate push button keyboard which gives you two different units and is rather unwieldy and expensive.

The other is to plump for our simple yet ingenious stick-on keyboard.

It's constructed from silicon rubber.

When pressure is applied the keys collapse giving a momentary contact with the TS1000/ZX81 keyboard.



This gives you an authentic full stroke feel like a proper push button keyboard.

The keyboard is extremely reliable.

Tests have shown the keys to have a life of approximately 3½ million depressions.

It will not discolor, it is resistant to heat and low temperatures and is dust and moisture proof.

The keyboard is attractive, enhancing the look of the computer with its black keys and matt finish fascia.

It also serves to protect the original flat keyboard from contact with potentially damaging objects.

The keyboard is simplicity itself to apply. To do so you merely wipe clean the original keyboard. Then remove the protective backing, place keyboard centrally on the TS1000/ZX81 and press firmly into place.

No dismantling or soldering is required.

The keyboard increases the enjoyment you derive from your machine.

You can programme more quickly and accurately and your game playing results will almost certainly improve.

Moreover, the keyboard comes with a game-playing overlay which makes destroying alien spaceships that much easier.

As well as the overlay you get a sheet of stick-on labels as directional indicators or command signals. Additional overlays and labels are available from Secondbase at $1.50 per pack.

The keyboard is yours for $15.00.

# TS1000 PUSH BUTTON KEYBOARD.
